### SECTION 1

# **ADO Reports**

Report generation and performance have been improved with Vitalware 3.0 and it is now possible to report directly to an Open Database Connectivity (ODBC) data source and to an ActiveX Data Objects (ADO) RecordSet object, bypassing the ODBC filtering process.

The new report options are:

- Crystal Reports: report directly in ODBC format, bypassing the ODBC filtering process.
- Crystal ADO: report using ADO RecordSets for Crystal (which are accessible via Crystal's ADO connector).
- Microsoft ADO: report using ADO RecordSets for Microsoft products.

Crystal and Microsoft reports (Excel, Power Point and Word) which currently connect to an ODBC data source can be modified to use an ADO RecordSet.

It remains possible to create reports by connecting directly to an ODBC data source.

## Note

This document assumes familiarity with Report creation in Vitalware. Full details about Report Creation are available in the Vitalware Help: **Working with Vitalware records>Reports**.

## SECTION 2

# **Crystal Reports**

Creating a Crystal Report using the new ADO RecordSet is similar to creating a Crystal report with a direct ODBC connection. The main differences are in selecting the data source. This document describes the differences.

## How to create a Crystal ADO Report

In Vitalware:

1. Search for or otherwise list a group of records on which to report.

When designing a Crystal ADO report the records in your initial record set must have a value in each field to be included in the report. If not, the field name will not appear in the list of available columns. Once the report is defined, it does not matter if a record does not have values in every field included in the report.

- 2. Click **Reports** in the Tool bar to display the Reports box.
- 3. Click **New** in the Reports box. The Report Properties box displays.
- 4. Enter a descriptive name for the Report in the top text field.
- 5. Select Crystal ADO Report from the *Type* drop list:

	Report Properties	×
Report Type	Fields   Sort Order   Options   Security	
P	os Report	
Type:	Crystal ADO Report	] [
Language:	All Languages	
	🔲 Use Display Order	
Report File:	Download	
Size:	Upload	11
Modified:		-
	VOK X Cancel ? H	elp

6. On the Fields tab, add the fields to be included in the report. In this example the fields selected are:

Report Properties	x
Report Type Fields Sort Order Options Security	
Pos Report	
🔒 🖹 📑 🖓 🗛 🔹 🕨	
<ul> <li>IRN</li> <li>Insertion Date: (Insertion Details)</li> <li>Inserted By: (Insertion Details)</li> <li>Pending Refund</li> <li>Primary Status: (Record Status)</li> <li>SalOrdersRef_tab</li> <li>Name: (Applicant Details)</li> <li>Address: (Applicant Details)</li> <li>Postal Code: (Applicant Details)</li> <li>Summary Data</li> </ul>	
Add Remove Clear	]
✓ OK X Cancel ? He	lp

- Make changes on the other tabs as required. See the Vitalware Help for details about setting a sort order, sort options, and security.
- 8. Click **OK**.

The new report is added to the Reports box.

9. In the Reports box, select the new report and click to run the report for the first time.

A message will display indicating that your report does not exist on the server. This is to be expected as the report has not yet been built in Crystal Reports:

KE Vitalware	
A report file ha Do you want to	as not been specified. o start a new report?
Yes	<u> №</u>

10. Click Yes.

An xml file is generated and saved with the data from your record set. The location of this file can vary, but typically it can be found in:

```
C:\Users\[your
```

username]\AppData\Local\KESoftware\Reports\e[module name]
For example, a report run in the Parties module, will save the xmldata file to:

C:\Users\[your username]\AppData\Local\KESoftware\Reports\eparties The Crystal Reports Designer application will open.

11. On the Start Page of the Crystal Reports Designer, select **Blank Report** under the New Reports heading

-OR-

Select File>New>Blank Report in the Menu bar.

The Database Expert box displays:

말 Data	abase Expert	- 🗆 🗙
Data           Browse the data source for the tables you want to add.           (Note: to edit the alias for a table, select the table in the "Selected Tables' tree and click on it remet the follow")	tor	
(Note: to edit the alias for a table, select the table in the "Selected Tables" tree and click on it press the T2 key)         Available Data Sources:            • • • • • • • • • • • • • • •	c Selected Tables:	
	ОК Салсе	Help

12. Double-click **Create New Connection** and click 🗉 beside **ADO.NET (XML)**:

E.	Database Expert	_ 🗆 🗙
Data		
Data  Browse the data source for the tables you want to add.  (Note: to add the alias for a table, select the table in the 'Selected Tables' tree ar press the F2 key)  Available Data Sources:  Current Connection  Connectio		
		OK Cancel Help

The following screen will display:

<u>File Path</u> :	[]
Use Classes from Project:	
<u>C</u> lass Name:	M
Use DataSet from Class:	

13. Click the button beside the *File Path* field to locate and select the xmldata.xml file created when the report was first run (Step 9).

See Step 10 for details of the location of the  ${\tt xmldata.xml}$  file.

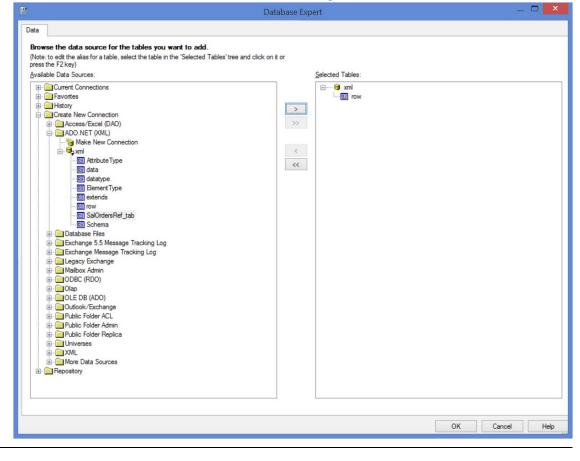

14. Click **Finish** to return to the Database Expert:

	Database Exper	t		_	
were the data source for the tables you want to add. te: to edit the alias for a table, select the table in the 'Selected Tabl ss the F2 key)					
vailable Data Sources: ⊕- ☐ Current Connections	<u>S</u> e	elected Tables:			
Favorites     Favorites	> >> <<				
More Data Sources     Point Repository					
			OK	Cancel	H

Field values from the POS module are contained in the table called  ${\tt row}.$ 

15. Select **row** and add it to the *Selected Tables* pane:

#### 16. Click **OK**.

The Crystal Report Designer displays, ready for you to design your Crystal report. See the Vitalware Help for details of designing a Crystal Report.

It is important not to move the xmldata.xml file as this will cause problems when sharing the report with other users.

# How to modify a Crystal Report to use ADO instead of ODBC

To modify a Crystal Report to use ADO rather than ODBC:

- 1. Open the Report Properties dialogue for the report.
- 2. Select **Crystal ADO Report** from the Type drop list:

	Report Properties	×
Report Type	Fields Sort Order Options Security	
	os Report	
Type:	Crystal ADO Report	
Language:	All Languages	
	🔲 Use Display Order	
Report File: Size: Modified:	Download	
	VOK X Cancel ? H	elp

The fields for this report are:

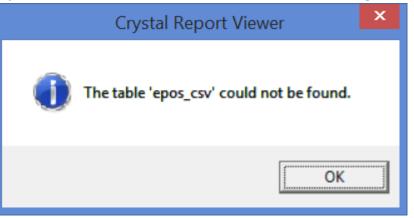

Report Properties	x
Report Type Fields Sort Order Options Security	
Pos Report	
🔒 🙀 📑 🚔 🖣 🗣 🖡	
<ul> <li>IRN</li> <li>Pending Refund</li> <li>Primary Status: (Record Status)</li> <li>SalOrdersRef_tab</li> <li>Name: (Applicant Details)</li> <li>Address: (Applicant Details)</li> <li>Postal Code: (Applicant Details)</li> <li>Summary Data</li> <li>Product: (Product Details)</li> <li>Price: (Product Details)</li> <li>Quantity: (Product Details)</li> <li>Sub-Total: (Product Details)</li> </ul>	
Add Remove Clear	
VOK X Cancel ? H	elp

Two tables are generated in this report.

3. Click **OK** and run the report.

Crystal will create the ADO record set and the following error will display:

 Open the Crystal report in the Crystal Report Designer and select the Database>Set Datasource Location menu option. The Set Datasource Location dialogue will display:

Set Datasource Location		×
Change the location of the data source by selecting the current database (or table) and choosing replace it with. Then click Update. Qurrent Data Source:  Qurrent Data Source:  Properties	the database (o	r table) to
Replace with: Current Connections Favorites For Create New Connection Repository		Update
	Close	<u>H</u> elp

5. Select **Create New Connection** in the *Replace with* pane and click ■ beside **ADO.NET (XML)**.

The following screen will display:

	ADO.NET (XML)	×
Connection Please enter connection	information	
<u>Fi</u> le Path :		
Use Classes from Project:		
Class Name:		V
Use DataSet from Class:		

6. Click the button beside the *File Path* field to locate and select the xmldata.xml file created when the report was run.

The location of this file can vary, but typically it can be found in:

C:\Users\[your

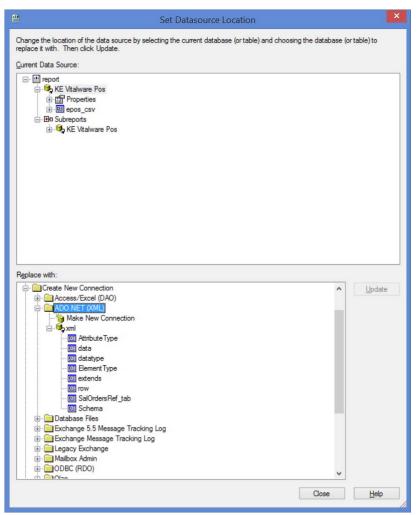

username]\AppData\Local\KESoftware\Reports\e[module name]
For example, a report run in the Parties module, will save the xmldata file to:
C:\Users\[your

username]\AppData\Local\KESoftware\Reports\eparties

7. Click **Finish**.

You are returned to the Set Datasource Location dialogue:

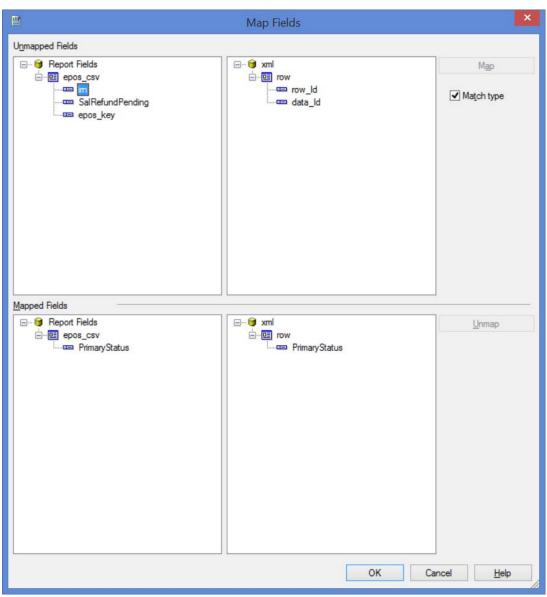

Next it is necessary to map fields from the old ODBC data source to the new ADO RecordSet.

In this example there are two tables to map and one sub-report.

- 8. To map the old ODBC POS fields to the new POS table, click **epos\_csv** in the *Current Data Source* pane and then click the **row** table in the *Replace with* pane. The Update button will be enabled.
- 9. Click the **Update** button and the Map Fields dialogue will display:

Fields with the same name will be mapped automatically.

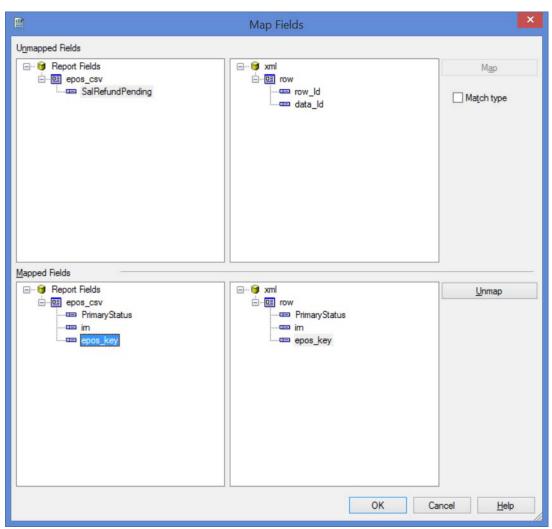

10. Uncheck the **Match type** check box to reveal more fields in the *Unmapped Fields* pane:

	Map Fields	×
Unimapped Fields		
Report Fields     epos_csv     arm     salRefundPending     epos_key	mi	Map Match type
Mapped Fields	mi mig row mig row mig PrimaryStatus	Unmap
	ОК С	Cancel <u>H</u> elp

11. Complete mapping fields in the *Unmapped Fields* pane. In this example we map  ${\tt epos\_key}$  to  ${\tt epos\_key}$  and irn to irn by selecting both fields to map and clicking the **Map** button. Once mapped, fields will be moved to the *Mapped Fields* pane:

- 12. Click **OK** when all fields are mapped. You are returned to the Set Datasource Location dialogue.
- 13. Repeat the mapping process for all fields (in this example, mapping fields in the SalOrder\_csv table to the ADO table SalOrdersRef\_tab):

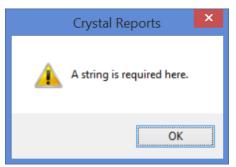

Set Datasource Location		×
Change the location of the data source by selecting the current database (or table) a replace it with. Then click Update. Current Data Source:	nd choosing the database (or t	able) to
Replace with:         Create New Connection         Access/Excel (DAO)         ADO.NET (XML)         Make New Connection         Xml         Attribute Type         data         Element Type         Element Type         Salorders Ref_tab         Schema         Database Files         Exchange 5.5 Message Tracking Log         Exchange         Maibox Admin         ODBC (RDO)		Update
	Close	Help

14. Once all fields have been remapped in all tables click **Close**.

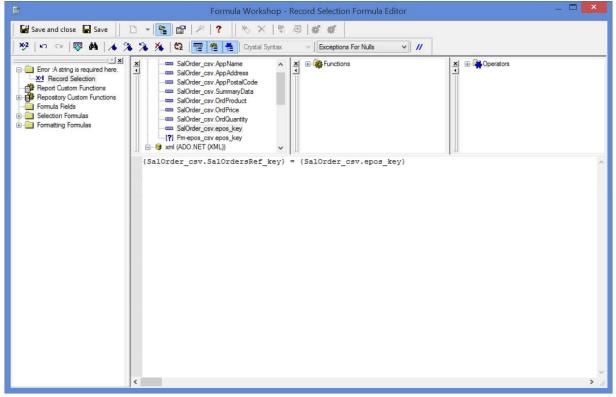

You are returned to the Crystal design window.

If you refresh report data at this stage and you have a sub-report object, you will probably receive an error regarding sub-report links, e.g.:

Click **OK** to open the Record Selection Formula Editor. Change the link key field used by the old ODBC table to the link key field referenced by the ADO RecordSet:

The report should now work correctly.

### SECTION 3

# **Microsoft Excel**

The following examples demonstrate how to create a basic Excel report using VBA. Please note that it is not the intention of this document to teach VBA.

Excel 2013 was used to create these reports.

# How to create an Excel Report using the ADO RecordSet

With ODBC data sources there is an option in Excel to open a connection without writing Visual Basic code. This is not the case when making a connection to an ADO record set and it is necessary to write VB code.

## Step 1: Create a new report in Vitalware

This first example is a simple report on single value fields from the POS module. The VBA code provided in this example will automatically populate headings and row data for each column selected.

In Vitalware:

- 1. Search for or otherwise list a group of records on which to report.
- 2. Click **Reports** in the Tool bar to display the Reports box.
- 3. Click **New** in the Reports box. The Report Properties box displays.
- 4. Enter a descriptive name for the Report in the top text field.
- 5. Select Microsoft ADO Report from the *Type* drop list:

	Report Properties	×
Report Type	fields Sort Order Options Security	
	ew Excel Report	
Type:	Microsoft ADO Report	
Language:	All Languages	·
	Use Display Order	
Report File: Size: Modified:	Download	
	VOK X Cancel ? H	elp

6. On the **Fields** tab add the fields to be included in the report. Fields selected in this example are:

Report Properties	×
Report Type Fields Sort Order Options Security	
New Excel Report	
🔒 🙀 📑 🖶 🖣 🖓 🖓	
<ul> <li>IRN</li> <li>Primary Status: (Record Status)</li> <li>Summary Data</li> <li>Total/Total: (Balances Given)</li> <li>Received/Received: (Payments Taken)</li> <li>Balance: (Balances Given)</li> </ul>	
Add Remove Clear	
VOK X Cancel ? H	elp

- Make changes on the other tabs as required. See the Vitalware Help for details about setting a sort order, sort options, and security.
- 8. Click **OK**.

The new report is added to the Reports dialogue box.

9. Select the new report and click **Report All** to run the report for the first time. A message will display indicating that your report does not exist on the server. This is to be expected as the report has not yet been built in Excel:

KE Vitalware	
A report file ha Do you want to	is not been specified. o start a new report?
Yes	<u>⊗</u> №

10. Click Yes.

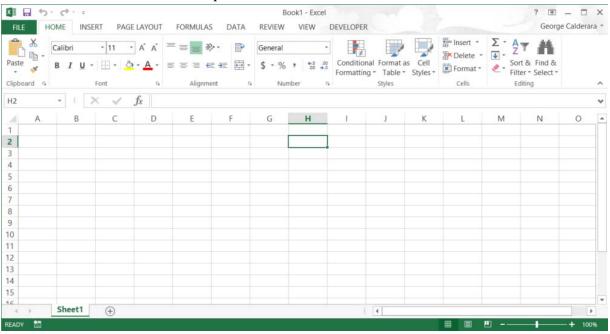

An xml file is generated and saved with the data from your record set. The location of this file can vary, but typically it can be found in:

```
C:\Users\[your
```

username]\AppData\Local\KESoftware\Reports\e[module name]
For example, a report run in the Parties module, will save the xmldata file to:
C:\Users\[your

username]\AppData\Local\KESoftware\Reports\eparties

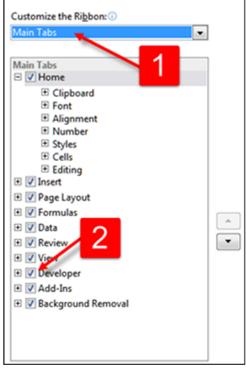

Microsoft Excel will open with a blank worksheet as follows:

#### Ensure that Excel is setup correctly

If the Developer tab does not display in the Ribbon:

- 1. Click File>Options>Customize Ribbon.
- 2. With **Main Tabs** selected from the *Customize the Ribbon* drop list (1), select the **Developer** check box (2):

In order to run the macros that we will create with our reports, we need to ensure that the Security level in Excel is appropriate:

- 1. On the Developer tab, click 🔔 Macro Security
- 2. Enable all macros:

3. Click **OK** to close the Trust Center.

4. On the Developer tab, click Bar The following screen displays:

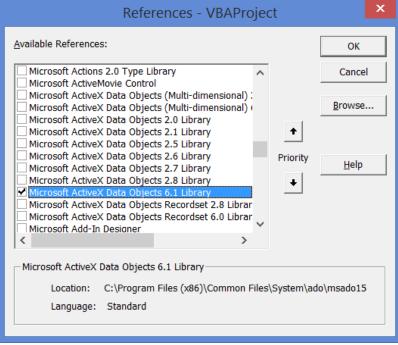

2						Microsoft	Visual Basic	for Applications - Book1	_ 🗆 👗
Eile Edit View	Insert Format Debu	g <u>R</u> u	n Iool	s <u>A</u> dd-	ns <u>W</u> i	ndow <u>H</u> elp			
1 🖾 • 🖬 🔺	5 B A 9 C	e a				2 0		1	
Project - VBAProj	ect 2	×							
		-

Visible	-1 - xiSheetVisible								

5. Ensure that the Microsoft ActiveX Data Objects Library is available:

#### 5.1. Select Tools>References in the Menu bar

In the References – VBAProject dialogue that displays, make sure that the following checkbox is checked:

5.2. Click OK.

## **Step 2: Design the report in Excel**

#### 1. Double-click **Sheet1** in the VBAProject pane:

🔁 Microsoft Visual	Basic for Appl	ications -	Book1 -	[Sheet1	(Code)]

2. Co	opy and	l past	e the	e foll	owi	ng VR	code:				
Sı	ıb Ope	nAdo	File	e()							

Dim RecordSet As ADODB.RecordSet Dim Worksheet As Excel.Worksheet Dim h As Long Dim col As Long Dim datarow As Long Dim source As String

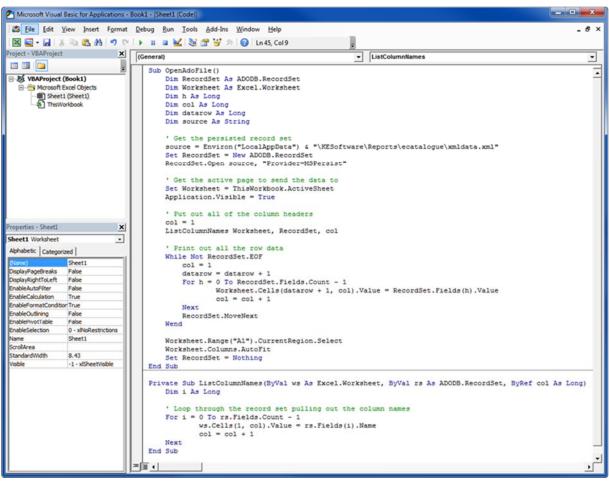

```
' Get the persisted record set
source = Environ("LocalAppData") & "\KESoftware\
Reports\epos\xmldata.xml"
Set RecordSet = New ADODB.RecordSet
RecordSet.Open source, "Provider=MSPersist"
' Get the active page to send the data to
Set Worksheet = ThisWorkbook.ActiveSheet
```

```
Application.Visible = True
```

```
' Put out all of the column headers col = 1
```

```
ListColumnNames Worksheet, RecordSet, col
    ' Print out all the row data
    While Not RecordSet.EOF
        col = 1
        datarow = datarow + 1
        For h = 0 To RecordSet.Fields.count - 1
                Worksheet.Cells(datarow + 1, col).Value =
RecordSet.Fields(h).Value
                col = col + 1
        Next
        RecordSet.MoveNext
    Wend
    Worksheet.Range("A1").CurrentRegion.Select
    Worksheet.Columns.AutoFit
    Set RecordSet = Nothing
End Sub
Private Sub ListColumnNames(ByVal ws As Excel.Worksheet, ByVal
rs As ADODB.RecordSet, ByRef col As Long)
    Dim i As Long
    ' Loop through the record set pulling out the column names
    For i = 0 To rs.Fields.count - 1
            ws.Cells(1, col).Value = rs.Fields(i).Name
            col = col + 1
    Next
End Sub
```

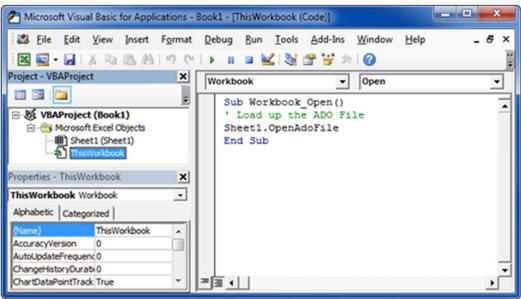

3. Double-click **ThisWorbook** in the VBAProject pane and copy and paste the following code:

Sub Workbook\_Open()

' Load up the ADO File Sheet1.OpenAdoFile End Sub

4. Save the report as macro enabled and upload it to your Vitalware report (page 22) on the Report Type tab of the Report Properties box.

When the report is run in Vitalware, an Excel report is generated:

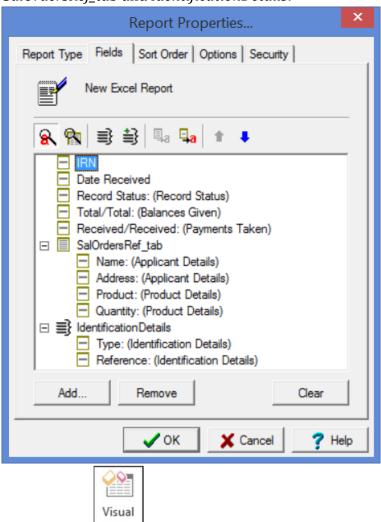

6	<b>ب</b> ج ا					POS11 - E	Excel				Sign in 🛛 🛣			×

# How to create an Excel Report with nested tables using the ADO RecordSet

Repeat Step1: Create a new report in Vitalware (page 22).
 For this example, the following fields were selected. Note the two nested tables

 SalOrdersRef\_tab and IdentificationDetails:

- 2. In Excel, click Basic on the Developers tab.
- 3. Double-click **Sheet1** in the VBAProject pane:
- 4. Copy and paste the following VB code:

#### Sub Read\_XML\_Data()

```
Dim rst As ADODB.Recordset
Dim Worksheet As Excel.Worksheet
Dim i As Long
Dim j As Long
Dim source As String
Dim datarow As Long
```

```
Dim saverow As Long
    Dim lastrow As Long
    Dim col As Long
    ' The next declaration is a little odd. Its needed in cases
where the entire value
    ' of a nested table is blank. In these cases it is necessary
to force a number of columns to be skipped when printing
    ' out field values. Oddly, as long as a nested table has
at least one value, then there is no issue.
    ' There is only a need to declare one variable for each
nested table.
    ' In this example there are only two nested tables so two
declarations are needed
    ' The value assigned to each variable will depend on the
number of fields in that nested table.
    1
      In this example the first nested table
                                                      is
                                                          the
SalOrdersRef_tab, which has four fields,
                                               i.e. AppName,
AppAddress, OrdProduct and OrdQuantity
    ' and the second nested table, i.e IdentificationDetails,
has
       2
             fields,
                        i.e.
                                IdeIdentificationType
                                                          and
IdeIndentificationReference
    Dim firstnestedtable As Long
    Dim secondnestedtable As Long
    Dim nestedtablecount As Long
    firstnestedtable = 4
    secondnestedtable = 2
    nestedtablecount = 1
    ' Get the persisted record set
    source
                   =
                            Environ("LocalAppData")
                                                            δ
"\KESoftware\Reports\epos\xmldata.xml"
    Set rst = New ADODB.Recordset
    rst.Open source, "Provider=MSPersist"
    ' Get the active page to send the data to
    Set Worksheet = ThisWorkbook.ActiveSheet

```

 Double-click ThisWorbook in the VBAProject pane and copy and paste the following code: Sub Workbook\_Open()

```
' Load up the ADO File
Sheet1.Read_XML_Data
End Sub
```

6. Save the report and upload it to your Vitalware report (page 22) on the Report Type tab of the Report Properties box.

When the report is run in Vitalware, an Excel report is generated:

# **Registry entries**

The Type Registry entry indicates which export type to use for each report request. The format of this Registry entry is;

System | Setting | Reports | Type | Crystal CSV | value

value	is 0 or 1:
	<sup>0</sup> Generates data in the existing format.
	<sup>1</sup> Generates data in the new Crystal ODBC format.
	If this entry is not present, a <i>value</i> of 0 is assumed.
System Set	ting Reports Type Crystal ADO  <i>value</i>
value	is 0 or 2:
	<sup>0</sup> Generates data in the existing format.
	<sup>2</sup> Generates data in the new Crystal ADO record set.
	If this entry is not present, a <i>value</i> of 0 is assumed.
System Set	tting Reports Type Microsoft ADO  <i>value</i>
where:	
value	is 0 or 3:
	<sup>0</sup> Generates data in the existing format.
	<sup>3</sup> Generates data in the new Microsoft ADO format.
